## The simple way to perfect lighting

The benefits of smart lighting concepts are an important aspect of contemporary kitchen planning. A wide variety of energy-efficient LED lights provide lighting atmospheres that are tailored to your needs. Naber offers specialist retailers the right technical systems for implementing individual room lighting design. The MEC converter system represents a big step forward in terms of simplification and connection to existing systems. With its high compatibility, it meets the requirements of a convenient smart home lighting 2.0 system.

LED converters and various function modules form the basis of LUMICA® MEC. The MEC converter converts the mains voltage to the output voltage used by LED lights. What makes it special: it can output both 12 volts and 24 volts. It is available in four power levels between 18 and 120 watts.

### **Innovative and space-saving**

Like the connection of the LED lights, the combination and switching of the lights and light groups is innovatively simple and space-saving. The more complex the lighting scenarios for kitchens and living areas are, the more helpful this system is. On the one hand, the function modules for connecting the colour-changing LED lights and light groups can be combined with each other any way you like. On the other hand, they are highly compatible and offer slots for sensors and switches.

Existing LED lights can easily be integrated into the lighting control or an existing smart home system. If the ZigBee modules of the converter are registered in the Zigbee 3.0 standard via the Philips Hue Bridge and a smart speaker is integrated into the smart home system, the lighting scenarios can be controlled extremely conveniently by voice command.

The structure of LUMICA® MEC and the many options the system offers

for individual and scenic room lighting are explained in detail in a new magazine article on [naber.com](https://naber.com). This converter system is likely to make it all the more appealing for end users to tailor the lighting in an increasing number of living areas and to quickly switch from one lighting scenario to the next.
